

**Are you worried about
business partners misusing
shared information ?**

What happens with information shared with partners when the collaboration ends? Information shared during temporary / project based relationships continues to be retained and sometimes misused by the partner leading to Intellectual Property losses.

SECLORE FILESECURE

Share with Confidence !

Seclore FileSecure protects intellectual property from being misused after projects are concluded and business relationships have ended. Information shared with business partners can be "retracted" after legitimate use. Even during the relationship information usage can be controlled.

Seclore FileSecure allows enterprises to define and implement information usage policies. A policy is an "answer" to four Questions i.e.

WHO can use the information

People & groups within and outside of the organization can be defined as rightful users of the information

WHAT can each person do

Individual actions like reading, editing, printing, distributing, copy-pasting, screen grabbing etc. can be controlled

WHEN can he use it

Information usage can be time based e.g. can only be used by Mr. A till 25th Sept or only for the 2 days

WHERE can he use it from

Information can be linked to locations e.g. only 3rd floor office by private/public IP addresses

When sharing information with external agencies, Seclore FileSecure allows the control of the information to be retained by the owner and can significantly reduce the delays and costs associated with system and process audits.

Seclore Technology (incubated and promoted by IIT, Bombay) is a leading provider of information security solutions in the areas of information usage control, information rights management (IRM) and secure outsourcing. Its expertise lies in protection of data post distribution irrespective of its location or mode of transfer.
